                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a kinase polypeptide. The kinase polynucleotides and polypeptides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for the detection of mutant kinases, or inappropriately expressed kinases for the diagnosis of a disease or disorder. They are useful for screening for drugs (or high throughput screening of combinatorial libraries) effective in the treatment of symptomatic or phenotypic manifestations of that disease or disorder. The polynucleotide sequence is useful as a source of probes and primers, which can be used to screen libraries, isolate

                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and strin, inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and therapy, drug screening, assays for receiver activity, arthritis and inflammation, leukaemias and constructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed

```
The present invention relates to human kinases (PKIN) and the nucleic acids encoding them. PKIN is used as vaccine and in gene therapy. PKIN is used in the prevention, diagnosis and treatment of diseases cancers, adenocarcinoma, leukemia, sarcoma, immune disorder, Addison's disease, adenocarcinoma, leukemia, sarcoma, immune disorder, Addison's disease, cout, microbial infections, cardiovascular disease and/or inflammation, myasthenia gravis, atherosclerosis, cirrhosis, osteoporosis, myocardial infections, cardiovascular disorder, seizure disorder, infammation, myasthenia gravis, atherosclerosis, cirrhosis, osteoporosis, myocardial infaction, cataract, growth and development disorder, seizure disorder, pulmonary embolism, dauchar's disease, renal disorder, seizure disorder, gissase, prok's disease, renal disorder, seizure disorder associated with decreased PKIN. PKIN may be used to treat disorders associated with decreased PKIN. Complement the patients own production of PKIN, PKIN nucleic assuptonent the patients of production of PKIN, PKIN nucleic acid and the complementary sequences may also be used as DNA probes in nucleic assays to detect and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be nucleic acid sequences in samples and therefore which patients may be need of restorative therapy. The present sequence is human PKIN-2 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5
                                                                                                                                                                                                                                                Yue H, Gandhi AR, Tribouley CM, Kearney L, Griffin JA, Nguyen DB; Bandman O, Lu DAM, Lal P, Burford N, Khan FA, Walia NK, Yao MG; Patterson C, Burrill JD, Marcus GA, Zingler KA, Recipon SA, Lu Y; Policky JL, Thornton M, Tang YT, Hafalia A, Elliott VS, Baughn MK; Walsh RT, Ramkumar J, Borowsky ML, Au-young J, Hillman JL;

                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and chromotars.
                                                                                                                                                                                                                      ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       260 AGCTGAAGAGAGAGAGCAACTGCTTTTGCTGTGAAGTGTATCCCTAAGAAGGCGCT 319

                                                                                                                                                                                                                                                                                                                         ŏ
                                                                                                                                    Ass06701-AAS06757 encode for novel human protein kinases #1-57. The
novel protein kinases have been identified as members of the tyrosine
or setine/threohine kinase (PTK and STK) familites. The polymouleotides
corstine/threohine kinase (PTK and STK) familites. The polymouleotides
corstine/threohine kinases and the polymoptides may be used in the
provention, diagnosis and treatment of diseases associated with
tages (aspecially cancers of hematopoletic origin), cardiovascular
cancers (aspecially cancers of hematopoletic origin), cardiovascular
disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes),
immune related diseases (e.g. rheumatorid arthritis), neurological
disorders (e.g. schizophrenia), neurodegenerative disorders (e.g.
parkinson's disease), inflammatory disorders (e.g. infertility).
Additionally, polymocleotides encoding protein kinases may be
used for gene therapy and as DNA probes in diagnostic assays.
The protein kinase polypeptides may be used as antigens in the production
of antibodies against the protein kinases and in assays to identify
modulators of protein kinase expression and activity.

The present sequence encodes a kinase polypeptide. The kinase polynucleotides and polypeptides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for the detection of mutant kinases, or inappropriately expressed kinases for the diagnosis of a disease or disorder. They are useful for screening for drugs (or high throughput screening of combinatorial libraries) effective in the treatment of symptomatic or phenotypic manifestations of that disease or disorder. The polynucleotide sequence is useful as a source of probes and primers, which can be used to screen libraries, isolate clones, and prepare cloning and sequencing templates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            426

The kinase polynucleotides and polypeptides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for the detection of mutant kinases, or inappropriately expressed kinases for the diagnosis of a disease or disorder. They are useful for screening for drugs (or high throughput screening of combinatorial libraries) effective in the treatment of symptomatic or phenotypic manifestations of that disease or disorder. The polynucleotide sequence is useful as a source of probes and primers, which can be used to screen libraries, isolate clones, and prepare cloning and sequencing templates.

The present sequence is the coding sequence for Murine Dendritic Cell Kinase 3 (MDCK-3). The protein encoded by the present sequence is useful for treating a variety of disorders listed in the disclosure of the specification, including autoimmune disorders, allergic reactions, myeloid or lymphoid cell deficiencies, wound healing and tissue repair and replacement, burns, inclisions and ulcers, periodortal disease, inflammatory diseases, tumours and bacterial, viral or fungal infection. MDCK-3 is a member of the Ca2+/calmodulin-dependent kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                       Novel murine and human kinase nucleic acids useful for treating inflammations, infections, tumors, allergies, autoimmune diseases, and for stimulating or suppressing immune responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 186

      Library is
male lung, age 27; and 1 male testis, age 69. Library 1: oligo-dT primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.8 kb, Library is normalized and enriched for full-length clones and was constructed by Gruber (Invitrogen). Research Genetics tracking code 021. Note: this is a NIH_MGC Library."

pcMV-SPORT6; Site_1: NotI; Site_2: EcoRV (destroyed);

male lung, age 27; and 1 male testis, age 69. Library is
oligo-dr primed and directionally cloned (EcoRV site is
destroyed upon cloning). Average insert size 1: 8 kb,
insert size range 1-3 kb. Library is normalized and
enriched for full-length clones and was constructed by C.
Gruber (Invitrogen). Research Genetics tracking code
